COVID-19 | IgG Antibody Test FAQ's

How can I get a Test?

Simply click [here](#) to get started. A physician's order is not required to take this test.

How much does the test cost?

The cost of the IgG Antibody test is \$75.

Should I get tested?

This test may be right for you if:

- You are not currently experiencing any symptoms consistent with COVID-19 (Information about symptoms can be found on the CDC website)
- You have not experienced a fever in the past 3 days
- You had or suspect you have had COVID-19, but have not experienced any new symptoms in the past 10 days

DO NOT Take this test if:

- You are feeling sick, or have had a fever within the last 3 days
- You think you currently have COVID-19 and want to confirm this (Please click [here](#) to schedule)
- You have been diagnosed with COVID-19 less than 10 days ago
- You were directly exposed to the virus within the last 14 days
- You have a condition that weakens your immune system

Can my child be tested?

Aria Diagnostics will test minors under 18 years of age as long as a parent or legal guardian authorizes Aria Diagnostics to perform the testing.

What should I expect when getting tested?

When you arrive at Aria Diagnostics, a phlebotomist will take a blood sample. You do not need to do anything to prepare for the test. For more information about COVID-19 testing, visit the [FDA](#) website or [CDC](#) website.

How long will my results take?

The test results will take up to 72 hours to process. Once Aria Diagnostics has received your results, they will be emailed via a secure link directly to you. If you have not received your results in 72 hours, please email covidtest@ariadx.com.

PLEASE DO NOT CALL THE LAB. WE CAN NOT RELEASE RESULTS OVER THE PHONE.

How accurate is this test?

99% Sensitivity & 99% Specificity. [Learn more.](#)

If I get tested, what will the results tell me?

Your results will help identify if you were exposed to the virus that causes COVID-19 and, if so, whether or not your body has developed antibodies. Although having antibodies usually gives immunity from further infection, there is not enough evidence at this point to suggest that having the IgG antibodies will protect against future SARS-CoV-2 virus. The results of this test will NOT provide information on whether you can spread the virus to others and is not used as a basis for diagnosis.

Many factors can impact the results of the IgG antibody test, including how much time has passed since exposure to the virus and lack of adequate immune response. In addition, the serology (antibody) test may detect IgG antibodies from previous exposure to coronaviruses other than SARS-CoV-2, which although uncommon, can produce a false positive result. Your results will be provided via secure email for you to print or view. Your results will also be shared to public health authorities where required by law.
